Todd,

We are using a homegrown system that employs a login script that writes to a database to get the seat information.
We use ColdFusion to access the database and provide the seat counts.

If you have a couple years to develop the basics, and someone to support the servers that it runs on, make your own.

If you have the budget, I have heard good things about LabStats. http://www.computerlabsolutions.com/index.php.

Tips and tricks; understanding what you are doing is very important if you make your own. Infrastructure, installation, support and testing are all part of the package.
